INTRODUCTION

Example of trees

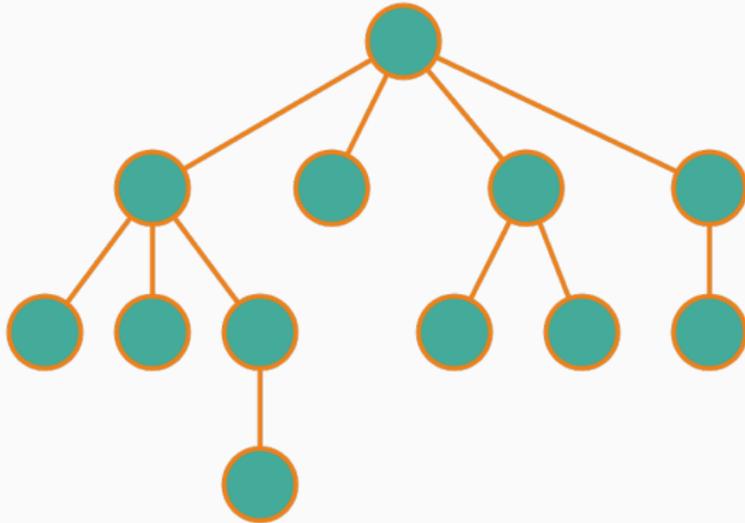

- XML document
 - Wikipedia: 249,376,957 nodes.
 - Open Street map: 2,337,888,179 nodes.
- Suffix trees
 - Protein document: 335,360,503 nodes.
 - DNA document: 577,241,087 nodes.

- A succinct representation of a tree reduces the space needed to represent it while supporting operations in optimal time [*Jacobson, 1989*].
- Still, succinct tree representations are costlier to build than traditional representation, e.g., pointer-based representations.
- Multicore parallelism has been successful in improving construction of other succinct data structures, such as, **Wavelet trees** [*Fuentes-Sepúlveda et al., 2014*].
- Our paper's contribution: A theoretical and practical algorithm for succinct tree construction on multicore *SMP* machines.

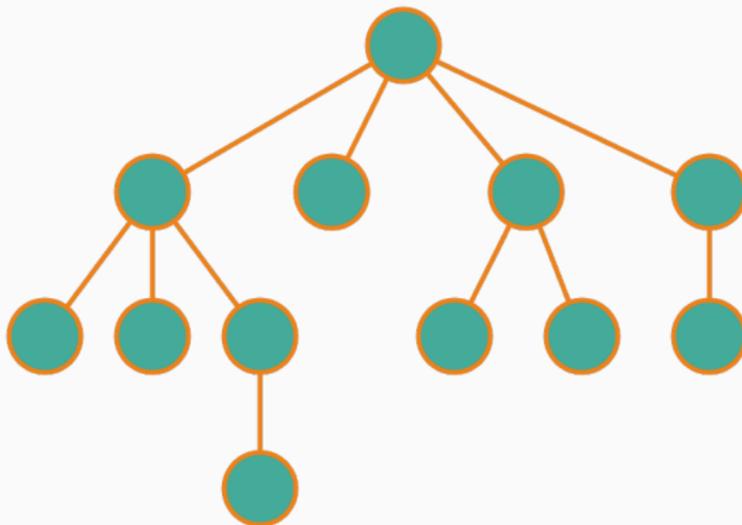

PRELIMINARIES

- A succinct data structure is a space-efficient representation of a data structure which uses $(1 + o(1))lwr$ bits.
- In particular, the information-theoretic lower bound to represent the topology of a tree with n nodes is $2n$ bits.
- A work proposes succinct tree representation that uses $2n + O(n/\text{polylog}(n))$ bits [Navarro and Sadakane, 2014].

RANGE MIN-MAX TREE: OBSERVATIONS

- The range min-max tree reduces a large set of operations on trees to a small set of primitives operations.
- The representation of the range min-max tree consists of four arrays e' , m' , M' and n' .
- e' does not store excess values of the internal nodes.
- In the range min-max tree siblings can be computed independently.

PARALLEL SUCCINCT TREE ALGORITHM

PARALLEL SUCCINCT TREE ALGORITHM

A $(2n + o(n))$ -bit representation of an ordinal tree on n nodes and its balanced parenthesis sequence can be computed in $O(n/p + \lg p)$ time using $O(n \lg n)$ bits of working space, where p is the number of cores. This representation can support the operations in $O(\lg n)$ time.

EXPERIMENTS

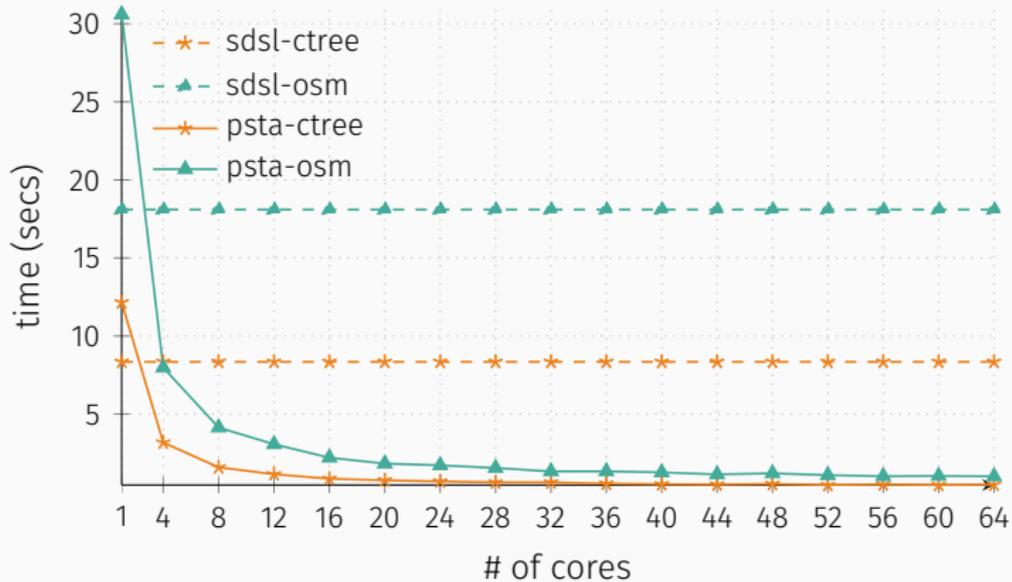

Compiler GCC 4.9 (Cilk branch)

Baseline SDSL and LibCDS

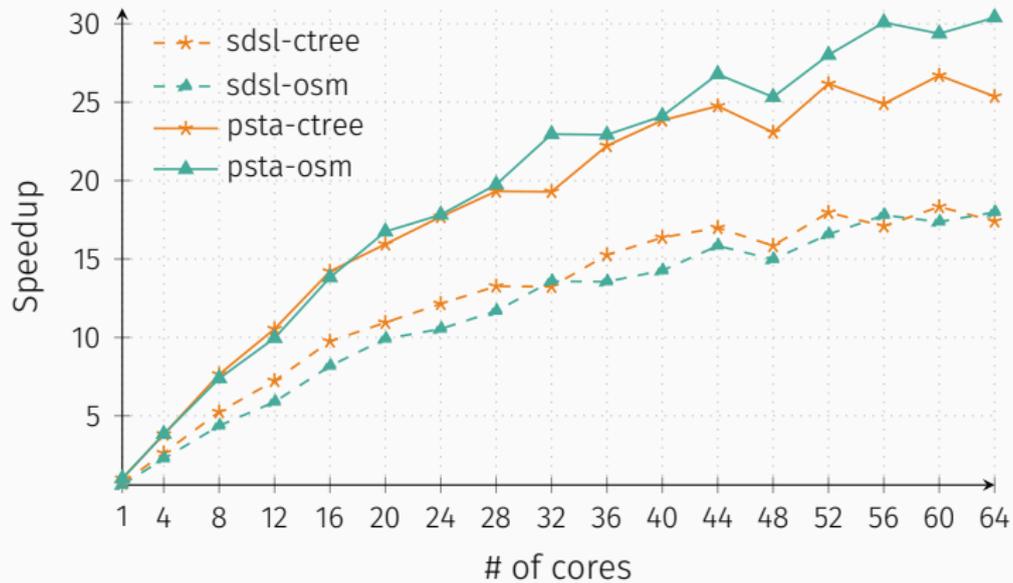

Machine Four 16-core AMD Opteron™ 6278 processors, clocked at 2.4GHz. L1 of 64KB per core, L2 of 2MB shared by 2 cores, L3 of 6MB shared by 8 cores and 189GB of DDR3 RAM, clocked at 1333MHz

	Dataset	Number of parentheses
Datasets	Wikipedia	498,753,914
	Protein	670,721,006
	DNA	1,154,482,174
	Complete tree	2,147,483,644
	Open Street map	4,675,776,358

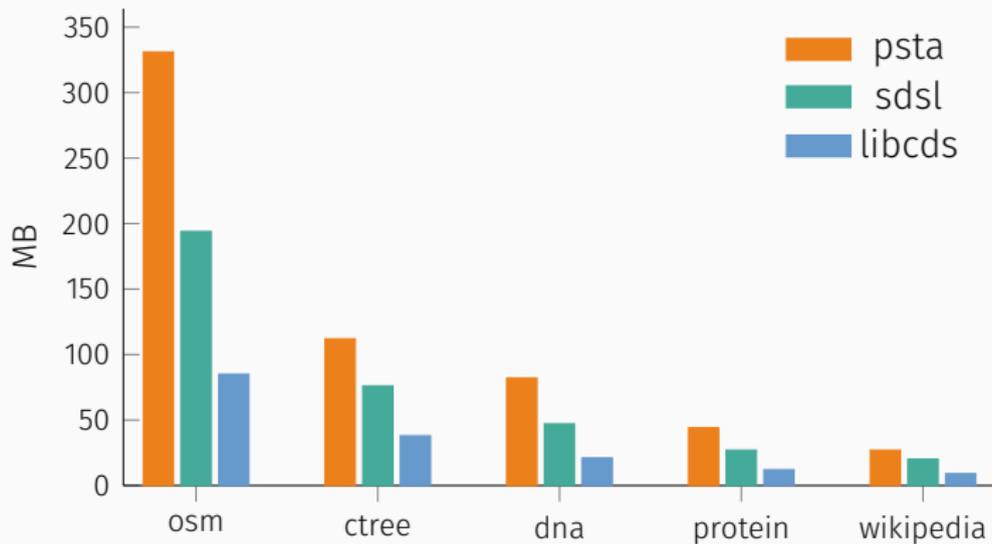

RESULTS: TIME

RESULTS: SPEEDUP

RESULTS: MEMORY CONSUMPTION

CONCLUSIONS

CONCLUSIONS

- We introduce a $O(n/p + \lg p)$ -time practical algorithm to construct a succinct representation of a tree with n nodes and p threads.
- The representation supports operations in $O(\lg n)$ time. The next step will be construct in parallel a representation that supports operations in $O(1)$ time.
- To use less memory in construction time we can reduce the number of bits per each elements in the arrays e' , m' , M' and n' .
- Our approach can be extended to the parallel construction of
 - Dynamic succinct trees
 - Succinct representation of labelled trees
 - Other succinct data structures that use succinct trees as building blocks, as for example, succinct representation of planar graphs.
